

Declaration of use of Generative Artificial Intelligence (GAI)

- Latest version from June 4th, 2025

Using GAI in your projects

If you use GAI-based tools in your exam project, you must submit a declaration crediting your use of GAI when you turn in your work, according to [Aarhus University's new rules and recommendations for using GAI-based tools](#).

Please keep in mind that: You only need to submit a GAI declaration *if you actually use GAI in your exam*. And you will *not* be expected to submit a declaration in connection with on-site exams.

If you *do* use GAI tools in your exam, you must state *which* tools you use and *how* you use them in your declaration.

The reason you need to submit a declaration if you use GAI is to avoid any issues in relation to the rules on exam cheating.

You will not be graded on how you use GAI-based tools. As always, your work will only be graded on the basis of the criteria described in the the learning outcomes in the course description or academic regulations. The only reason you need to submit a declaration is to document that you have reflected on your use of GAI and have thought about how to use these tools in a relevant and legitimate way.

However, you should be aware that using GAI is integrated into the learning outcomes for certain courses. In such cases, you'll be expected to include your reflections on your use of GAI-based tools in your paper in the section on methodology. Remember to check up on this this by asking you supervisor or your lecturer.

Keep in mind:

- Always remember to familiarise yourself with applicable rules and guidelines for using GAI on the AU student website studerende.au.dk.
- You'll also find more information on your study portal.
- Never put sensitive personal information or other confidential data in a GAI tool.
- If you use a GAI tool to generate text, you must declare how you used the tool. Remember to follow the [rules for how to paraphrase correctly](#).
- If you quote directly from a text generated by GAI, you must include a citation that states which GAI tool you used – find out how to do this on the [AU Library](#) website.

How to declare your use of GAI tools

At a minimum, your GAI declaration must contain the following:

1. Confirmation that you used GAI.
2. A list of the GAI tools you used.
3. Description of how you generated the output you used, including what inputs you used to generate it, and explain how you used the output in your exam project.

To complete your declaration, fill out this form:

Declaration of use of GAI tools

☒ **I/we used generative artificial intelligence (GAI) to complete this project** (*tick the box*). List the GAI tool(s) you used (remember to specify version):

Claude (Anthropic), Opus.4.8

I/we used GAI tools in the following way (*See accompanying list of possible uses for inspiration*)

EXAMPLES OF LEGITIMATE USE CASES FOR GAI

For inspiration in formulating a thesis statement

For inspiration in relation to choice of theory and method

☒ For feedback on own text

☒ For alternative ways of formulating text

To get started on my/our writing

To understand a topic better

To aid me in my reading process

I/we write about the topic of GAI in the project

To find gaps in our knowledge

To get started on my/our search for information

☒ For programming tasks

☒ For data analysis

To create diagrams

Other use case(s) (specify):

For each relevant use case, explain how you used GAI (see an explanation of the various possibilities on [Studypedia](#)). For example, if you used GAI to generate information, explain how you did this and how you used the output in your paper.

For feedback on own text: I wrote the interpretation sections for every question across all three assignments, commenting on the code output and answering the question. I then pasted my own text into Claude to get feedback on clarity and flow, and used those comments to tighten my wording. Nothing generated was copied into the report, the text inside each assignment is written by me.

For alternative ways of formulating text: I used Claude for rewording. I wrote the text myself, asked for alternative formulations, and kept only the phrasings that matched what I meant. All content and arguments are my own. For example, in Assignment 1, section 5, originally: “The two VaRs are almost the same at 2.32% and 2.42% so the normal assumption seems fine at the threshold, but parametric ES is 2.66% which gives a 1.15 ratio against the 1.60 historical one, showing it actually goes super wrong right after the cutoff and that's really why ES exists”. I asked for a clearer alternative, so the final version is: “Parametric ES is 2.66%, a ratio of 1.15 against the historical 1.60, yet the two VaRs are nearly identical at 2.32% and 2.42%. So the Normal assumption looks almost harmless at the threshold and badly wrong just past it, which is the real argument for ES”.

For programming tasks: I used Claude to adapt the Python code from the lecture sessions to my own project. The session scripts were built around the lecturer's example tickers, so I reworked them for my three stocks (AAPL, PFE, XOM) and my bloc's benchmark index. One task, for example, was to fetch three years of daily prices, compute returns, and inspect and handle data quality issues such as missing days and outliers while documenting the cleaning. I worked through that with Claude until it ran on my own stocks, then ran the scripts myself and edited them wherever the output or the logic looked wrong.

For data analysis: I used Claude to check my reasoning and to explain what the code was doing at each step, so I understood the output rather than just copying it. The modelling choices, interpretation and write-ups are my own.
